Re: Polychlorinated Biphenyls Notification Plan
Risk-Based Application Amendment 3
Proposed Additional Concrete Sampling Plan for Polychlorinated Biphenyls
Former Pechiney Cast Plate Facility
3200 Fruitland Avenue, Vernon, California

Dear Ms. Santos:

As discussed during the January 29, 2010 conference call, AMEC Geomatrix, Inc. (AMEC), is proposing to conduct additional concrete testing to further support the reuse of concrete containing PCBs below the site-specific remediation goal of 5.3 milligrams per kilogram (mg/kg) at the Pechiney Cast Plate, Inc. facility (facility or site). The site is located at 3200 Fruitland Avenue in Vernon, California. The additional sampling locations will be selected randomly across the existing concrete floor slab and the data will be used to augment the concrete data presented in the Polychlorinated Biphenyls Notification Plan (Plan).[1]

Proposed Concrete Sample Locations

The additional concrete sampling will focus on collecting concrete core samples from randomly selected locations across the site. Given the size of the remaining floor slabs (approximately 590,000 square feet), 40 CFR Part 761, Subpart N (761.265 for porous surfaces) and Subpart O (761.283 and 761.286) were used as a guide to develop a modified sampling approach that would be reasonable for the site conditions. The sampling approach consists of a 40-foot by 40-foot grid spacing overlain across the site, which is approximately synonymous with the spacing of the below grade footings and foundations. This grid was initiated in the northwest corner of the site as shown on Figure 1.

In addition to the modifications to the sampling approach, Subpart O was further consulted to assess the minimum number of samples required for verification sampling. According to Subpart O, the minimum number of samples required would be three for each matrix, with no upper limit specified for the total number of samples required. As noted in the Plan, over 250 concrete characterization samples have been collected and tested for PCBs. The additional

sampling proposed in this amendment will be used to augment the existing data by the collection and analysis of 50 randomly selected concrete samples locations from the proposed 40-foot by 40-foot grid.

To determine the random sampling locations, each grid was numbered starting at number 1 in the northwest corner of the site, and ending at number 455 in the southeast corner of the site. Once numbered, a random number generator was used to select random numbers between 1 and 455. As each random number was generated, the sample point was marked at the intersection of grid nodes at the southeast corner of the numbered grid for concrete sampling. Random sample grid numbers were excluded if the grid number either 1) fell within an area proposed for the removal and off-site disposal of concrete containing PCBs at concentrations greater than 5.3 mg/kg; or 2) fell outside the building slab in asphalt covered parking lots and/or driveways.

Using this random selection methodology, 50 random sample locations were identified for testing. These sample locations are shown on Figure 1.

Sampling and Analysis Procedures

Concert cores measuring approximately 1.5 inches in diameter and 3 inches in length (in accordance with 40 CFR Part 761; Subpart O; Section 761.286) will be collected at the proposed concrete sample locations using concrete coring equipment utilized by our subcontractor, Rice General Concrete Cutting Services of Long Beach, California. The concrete cores will be placed individually in resealable plastic bags and stored in an ice-chilled cooler. The core samples will be transported to the analytical laboratory, American Analytics of Chatsworth, California (American Analytics), to be crushed prior to analysis.

Sample documentation, handling, and transport will be conducted in accordance with the site-specific Quality Assurance Project Plan.[2]

Concrete core samples will be analyzed for Aroclors listed under EPA Method 8082 using a reporting limit of 200 micrograms per kilogram, or 0.2 mg/kg.

Decontamination of Concrete Coring Equipment

Concrete coring equipment will be decontaminated prior to use and between sampling locations using a 3-stage wash/rinse. Hexane will be used as a final rinse for the concrete coring equipment.

Waste Containment and Disposal

Decontamination wastewater and concrete slurry generated during concrete coring (investigation derived waste) will be containerized in Department of Transportation-approved 55-gallon drums and properly profiled, manifested, and disposed off-site at a licensed disposal facility.

Sincerely yours,
AMEC Geomatrix, Inc.
